- Introduction
- Methodology
- Results
- Conclusion
- Appendix

# Executive Summary

---

- Summary of methodologies
  - Data Collection
  - Data Wrangling
  - Exploratory Data Analysis (Data Visualisation and SQL)
  - Interactive Map (Folium)
  - Dashboard (Ploty Dash)
  - Classification (Predictive Analysis)
- Summary of all results

# Introduction

---

- Project background and context
  - SpaceX advertises Falcon 9 rocket launches on its website, with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage
  - Therefore, if one can accurately predict the likelihood of the first stage rocket landing successfully, the cost of a launch can be determined.
- Problems you want to find answers
  - What factors influences the success rate of a rocket landing?
  - How does each factor affect the landing success rate for a certain rocket type?
  - What conditions are required to achieve the highest landing success rate?

Section 1

# Methodology

# Methodology

---

## Executive Summary

- Data collection methodology:
  - SpaceX REST API
  - Web Scraping (Falcon 9 historical launch records from a Wikipedia page)
- Perform data wrangling
  - Transform data collected based on landing outcomes
  - Drop irrelevant columns
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - Build, tune, and evaluate classification models

# Data Collection

---

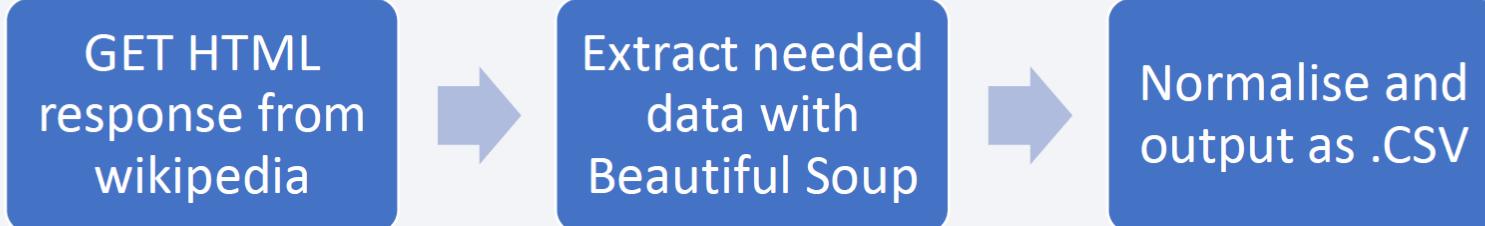

## 1. SpaceX REST API

- A series of GET requests were performed to return information from API in json format
- Data is subsequently normalized using Pandas to output a CSV file

## 2. Wikipedia Falcon 9 Launch data Web Scraping

- Extract Data using beautiful soup
- Normalize and output as CSV file

# Data Collection – SpaceX API

## 1. Get response from SpaceX API:

```
spacex_url="https://api.spacexdata.com/v4/launches/past"
response = requests.get(spacex_url)
print(response.content)
```

## 4. Construct dictionary:

```
launch_dict = {'FlightNumber': list(data['flight_number']),
'Date': list(data['date']),
'BoosterVersion':BoosterVersion,
'PayloadMass':PayloadMass,
'Orbit':Orbit,
'LaunchSite':LaunchSite,
'Outcome':Outcome,
'Flights':Flights,
'GridFins':GridFins,
'Reused':Reused,
'Legs':Legs,
'LandingPad':LandingPad,
'Block':Block,
'ReusedCount':ReusedCount,
'Serial':Serial,
'Longitude': Longitude,
'Latitude': Latitude}
```

## 2. Convert response as a dataframe:

```
data1 = response.json()
data= pd.json_normalize(data1)
data
```

## 3. Use Helper function to extract relevant :

```
getBoosterVersion(data)
getLaunchSite(data)
getPayloadData(data)
getCoreData(data)
```

## 5. Clean up unwanted data:

```
# Hint data[ 'BoosterVersion']!='Falcon 1'
data_falcon9 = data[data.BoosterVersion == 'Falcon 9']
data_falcon9.loc[:, 'FlightNumber'] = list(range(1, data_falcon9.shape[0]+1))
```

## 6. Address missing values

```
# Calculate the mean value of PayloadMass column
Mean_PayloadMass = data_falcon9.PayloadMass.mean()
# Replace the np.nan values with its mean value
data_falcon9['PayloadMass'] = data_falcon9['PayloadMass'].replace(np.nan, Mean_PayloadMass)
```

## 7. Output flat file (.CSV)

```
data_falcon9.to_csv('dataset_part_1.csv', index=False)
```

# Data Collection - Scraping

## 1. Define HTML Source

```
static_url = "https://en.wikipedia.org/w/index.php?title=List_of_Falcon_9_and_Falcon_Heavy_launches&oldid=1027686922"
response = requests.get(static_url).text
```

## 2. Create Beautiful Soup Object

```
soup = BeautifulSoup(response, 'html.parser')
```

## 3. Find tables

```
html_tables = soup.find_all("table")
print(html_tables)
```

## 4. Extract Column Header

```
column_names = []

# Apply find_all() function with 'th' element on first_launch_table
# Iterate each th element and apply the provided extract_column_from_header() to
# get a column name
# Append the Non-empty column name ('if name is not None and len(name) > 0') int
# o a list called column_names
temp = soup.find_all('th')
for x in range(len(temp)):
    try:
        name = extract_column_from_header(temp[x])
        if (name is not None and len(name) > 0):
            column_names.append(name)
    except:
        pass
```

## 5. Create dictionary

```
launch_dict = dict.fromkeys(column_names)

# Remove an irrelevant column
del launch_dict['Date and time ( )']

# Let's initial the launch_dict with each value to be an empty list
launch_dict['Flight No.']= []
launch_dict['Launch site']= []
launch_dict['Payload']= []
launch_dict['Payload mass']= []
launch_dict['Orbit']= []
launch_dict['Customer']= []
launch_dict['Launch outcome']= []
# Added some new columns
launch_dict['Version booster']= []
launch_dict['Booster landing']= []
launch_dict['Date']= []
launch_dict['Time']= []
```

## 7. Convert Dictionary into Dataframe

```
# df=pd.DataFrame(launch_dict)

headings = []
for key,values in dict(launch_dict).items():
    if key not in headings:
        headings.append(key)
    if values is None:
        del launch_dict[key]

def pad_dict_list(dict_list, padel):
    lmax = 0
    for lname in dict_list.keys():
        lmax = max(lmax, len(dict_list[lname]))
    for lname in dict_list.keys():
        ll = len(dict_list[lname])
        if ll < lmax:
            dict_list[lname] += [padel] * (lmax - ll)
    return dict_list

pad_dict_list(launch_dict, padel)
df = pd.DataFrame.from_dict(launch_dict)
df.head()
```

## 8. Output flat file (.csv)

```
df.to_csv('spacex_web_scraped.csv', index=False)
```

## 6. Append data to Dictionary keys

```
extracted_row = 0
#Extract each table
for table_number,table in enumerate(soup.find_all('table','wikitable plainlinks collapsible')):
    # Get table row
    for rows in table.find_all("tr"):
        # Check if first table heading is a number, corresponding to launch a number
        if rows.th:
            if rows.th.string:
                flight_number=rows.th.string.strip()
                flight_number=int(flight_number)
            else:
                flight_value
                #Get table element
                rows_value=rows.find_all('td')
                if len(rows_value) == 1:
                    #Append the flight number into launch_dict with key 'Flight No.'
                    launch_dict['Flight No.'].append(flight_number)
                    #Append date
                    date_value=rows_value[0].string
                    date_value=date_value[0:4]+date_value[5:7]+date_value[8:10]
                    date_value=date_value.replace(',','')
                    date_value=date_value.replace('.','')
                    date_value=date_value.replace('/','')
                    date_value=date_value.replace(' ','')
                    launch_dict[date].append(date_value)
                else:
                    # Date value
                    # 1000: Append the date into launch_dict with key 'Date'
                    date_value=rows_value[0].string
                    date_value=date_value[0:4]+date_value[5:7]+date_value[8:10]
                    date_value=date_value.replace(',','')
                    date_value=date_value.replace('.','')
                    date_value=date_value.replace('/','')
                    date_value=date_value.replace(' ','')
                    launch_dict['Date'].append(date_value)
                    # Time value
                    # 1000: Append the time into launch_dict with key 'Time'
                    time_value=rows_value[1].string
                    time_value=time_value[0:2]+time_value[3:5]+time_value[6:8]
                    time_value=time_value.replace(',','')
                    time_value=time_value.replace('.','')
                    time_value=time_value.replace('/','')
                    time_value=time_value.replace(' ','')
                    launch_dict['Time'].append(time_value)
                # Booster version
                # 1000: Append the bv into launch_dict with key 'Version booster'
                bv_value=rows_value[2].string
                bv_value=bv_value[0:4]+bv_value[5:7]+bv_value[8:10]
                bv_value=bv_value.replace(',','')
                bv_value=bv_value.replace('.','')
                bv_value=bv_value.replace('/','')
                bv_value=bv_value.replace(' ','')
                launch_dict['Version booster'].append(bv_value)
                # Launch Site
                # 1000: Append the ls into launch_dict with key 'Launch Site'
                ls_value=rows_value[3].string
                ls_value=ls_value[0:4]+ls_value[5:7]+ls_value[8:10]
                ls_value=ls_value.replace(',','')
                ls_value=ls_value.replace('.','')
                ls_value=ls_value.replace('/','')
                ls_value=ls_value.replace(' ','')
                launch_dict['Launch site'].append(ls_value)
                # Payload
                # 1000: Append the payload into launch_dict with key 'Payload'
                payload_value=rows_value[4].string
                payload_value=payload_value[0:4]+payload_value[5:7]+payload_value[8:10]
                payload_value=payload_value.replace(',','')
                payload_value=payload_value.replace('.','')
                payload_value=payload_value.replace('/','')
                payload_value=payload_value.replace(' ','')
                launch_dict['Payload'].append(payload_value)
                # Payload Mass
                # 1000: Append the payload mass into launch_dict with key 'Payload mass'
                payload_mass_value=rows_value[5].string
                payload_mass_value=payload_mass_value[0:4]+payload_mass_value[5:7]+payload_mass_value[8:10]
                payload_mass_value=payload_mass_value.replace(',','')
                payload_mass_value=payload_mass_value.replace('.','')
                payload_mass_value=payload_mass_value.replace('/','')
                payload_mass_value=payload_mass_value.replace(' ','')
                launch_dict['Payload mass'].append(payload_mass_value)
                # Orbit
                # 1000: Append the orbit into launch_dict with key 'Orbit'

                launch_dict['Launch outcome'].append(launch_outcome_value)
                # Booster Landing
                # 1000: Append the launch outcome into launch_dict with key 'Booster landing'
                booster_landing_value=rows_value[9].string
                booster_landing_value=booster_landing_value[0:4]+booster_landing_value[5:7]+booster_landing_value[8:10]
                booster_landing_value=booster_landing_value.replace(',','')
                booster_landing_value=booster_landing_value.replace('.','')
                booster_landing_value=booster_landing_value.replace('/','')
                booster_landing_value=booster_landing_value.replace(' ','')
                launch_dict['Booster landing'].append(booster_landing_value)
```

# Data Wrangling

---

1. Perform exploratory Data Analysis and determine Training Labels
  - Exploratory Data Analysis
  - Determine Training Labels
2. Calculate the number of launches on each site
3. Calculate the number and occurrences of each orbit
4. Calculate the number and occurrence of mission outcome per orbit type

# EDA with Data Visualization

---

- Scatter Plot of:
  - Flight Number vs Launch Site
  - Payload vs Launch Site
  - Flight Number vs Orbit type
  - Payload vs Orbit type
- Bar graph of success rate of each Orbit type
- Line graph of Yearly launch success trend

# EDA with SQL

---

- Insights gathered via SQL:
  - Display the names of the unique launch sites in the space mission
  - Display 5 records where launch sites begin with the string 'CCA'
  - Display the total payload mass carried by boosters launched by NASA (CRS)
  - Display average payload mass carried by booster version F9 v1.1
  - List the date when the first successful landing outcome in ground pad was achieved.
  - List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000
  - List the total number of successful and failure mission outcomes
  - List the names of the booster\_versions which have carried the maximum payload mass. Use a subquery
  - List the failed landing\_outcomes in drone ship, their booster versions, and launch site names for in year 2015
  - Rank the count of successful landing outcomes between the date 2010-06-04 and 2017-03-20, in descending order

# Build an Interactive Map with Folium

---

- Using Launch\_Site coordinates, launch data were marked on an interactive map to aid visualization
- Launch\_Outcome can also be visualized based on the classes:
  - Successful launch (Class 1) in Green
  - Failed launch (Class 0) in Red
- Distances between an identified launch site (CCAFS SLC-40) to its proximities were determined to answer some trends related to launch site location:
  - Are launch sites in close proximity to railways?
  - Are launch sites in close proximity to highways?
  - Are launch sites in close proximity to coastline?
  - Do launch sites keep certain distance away from cities?

# Build a Dashboard with Plotly Dash

---

- A Dashboard provide live trending of proportion of successful launches by varying launch site when SpaceX conducts new launches which will help to improve prediction accuracy overtime
- A Scatterplot of Launch Outcome vs Payload Mass (kg) for different booster versions provide an easily observable relationship between the variables

# Predictive Analysis (Classification)

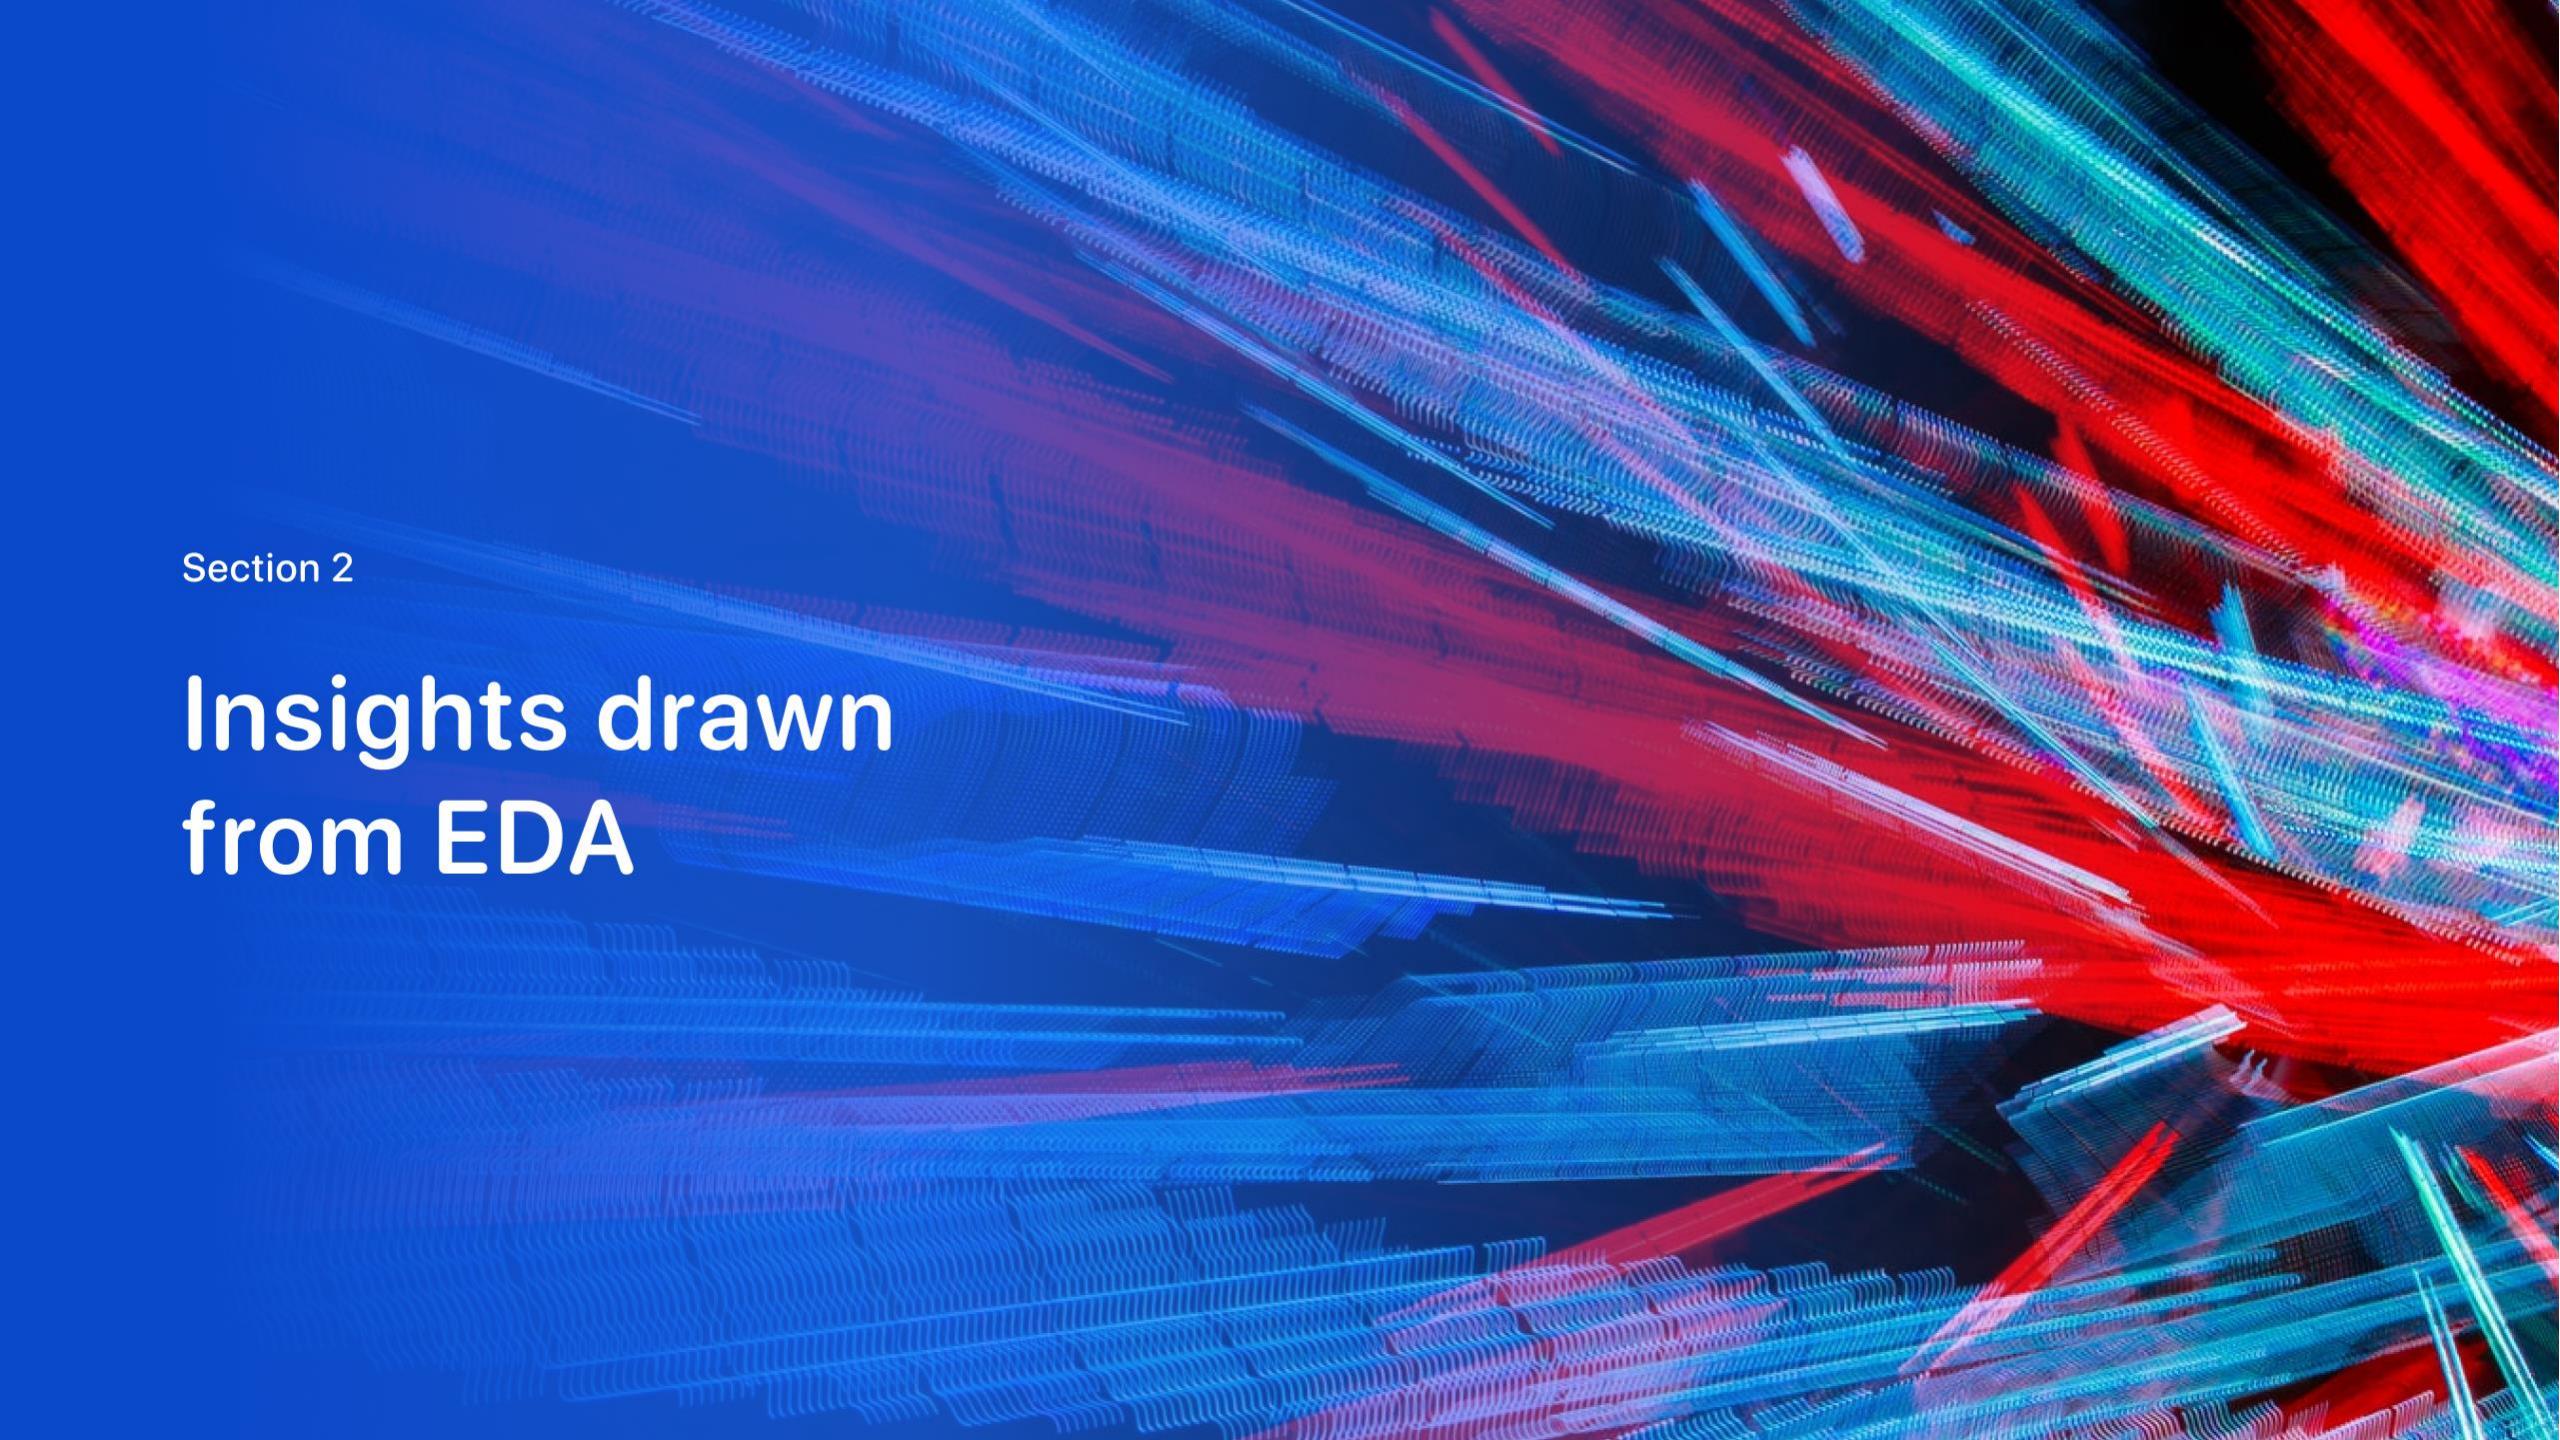

---

- Building the classification model
  - Load dataset into NumPy and Pandas
  - Transformation: Standardize data and reassign to variable
  - Split data to Train and Test set
  - Determine test sample count
  - Perform logistic regression object and create GridSearchCV
  - Fit dataset into GridSearchCV and train with dataset
- Evaluating and Improving the classification model
  - Check accuracy of each model
  - Get best parameter (Tuned Hyperparameters)
  - Plot Confusion Matrix
- Finding the best performing classification model
  - Determining the model with the best accuracy score

# Results

---

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

The background of the slide features a complex, abstract digital visualization. It consists of numerous thin, glowing lines that create a sense of depth and motion. The lines are primarily blue and red, with some green and purple highlights. They form a grid-like structure that curves and twists across the frame, resembling a three-dimensional space or a network of data points. The overall effect is futuristic and dynamic.

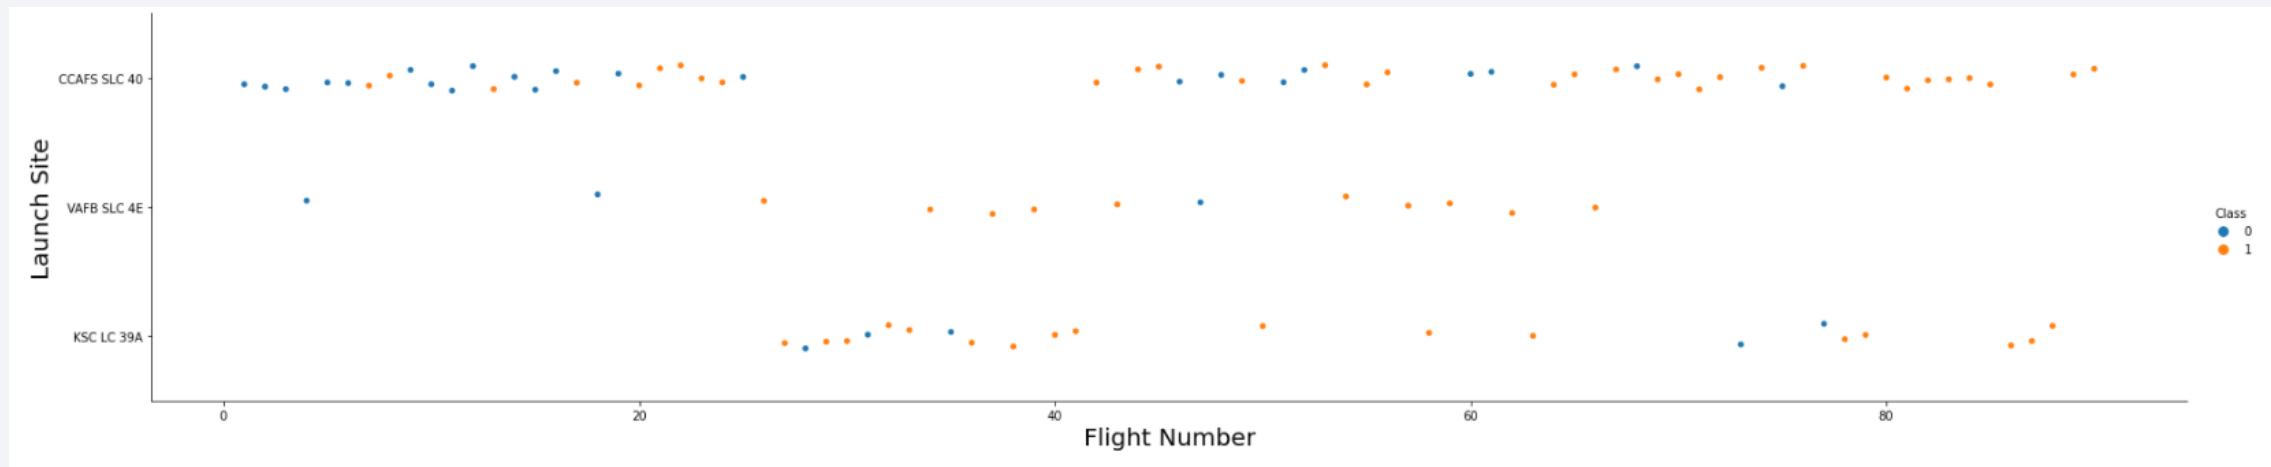

Section 2

## Insights drawn from EDA

# Flight Number vs. Launch Site

---

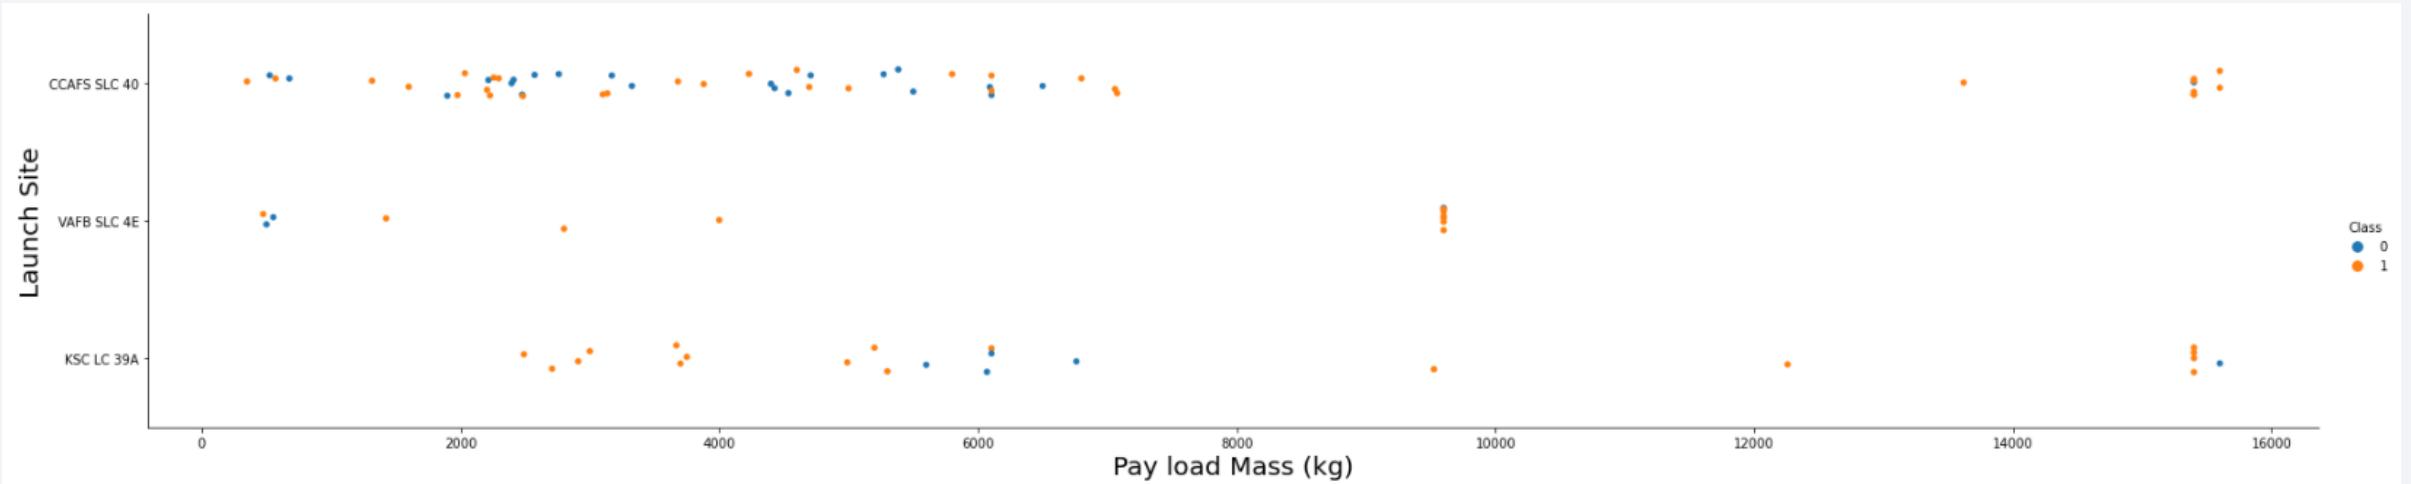

- Scatter plot of Flight Number vs. Launch Site

- General trend of higher success rate with higher flight number

# Payload vs. Launch Site

- Scatter plot of Payload vs. Launch Site

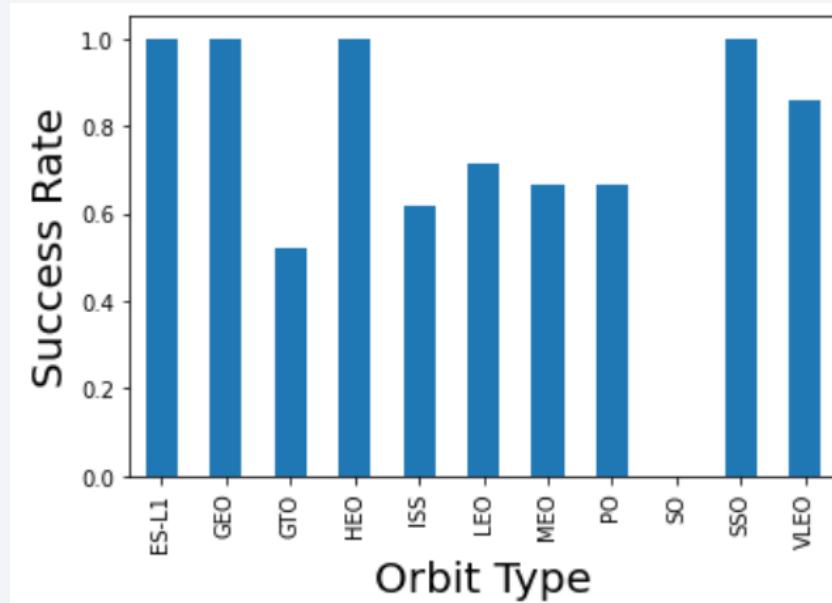

- Launches from CCAFS SLC 40 have a higher success rate at greater payload mass for
- No obvious trend if launch site is dependent on payload mass for successful launch

# Success Rate vs. Orbit Type

---

- Show a bar chart for the success rate of each orbit type

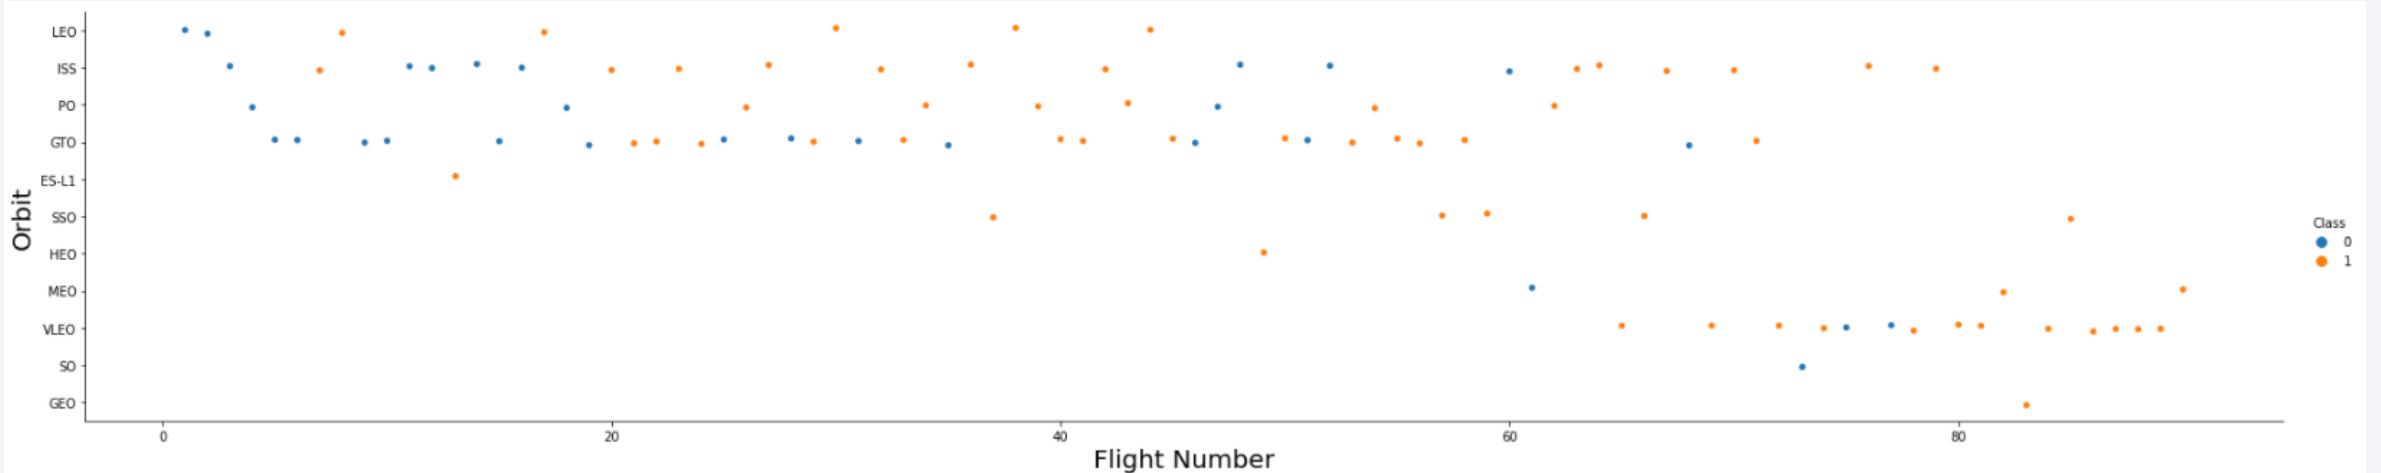

- Orbit type with the highest success rates are ES-L1, GEO, HEO, SSO

# Flight Number vs. Orbit Type

---

- Scatter point of Flight number vs. Orbit type

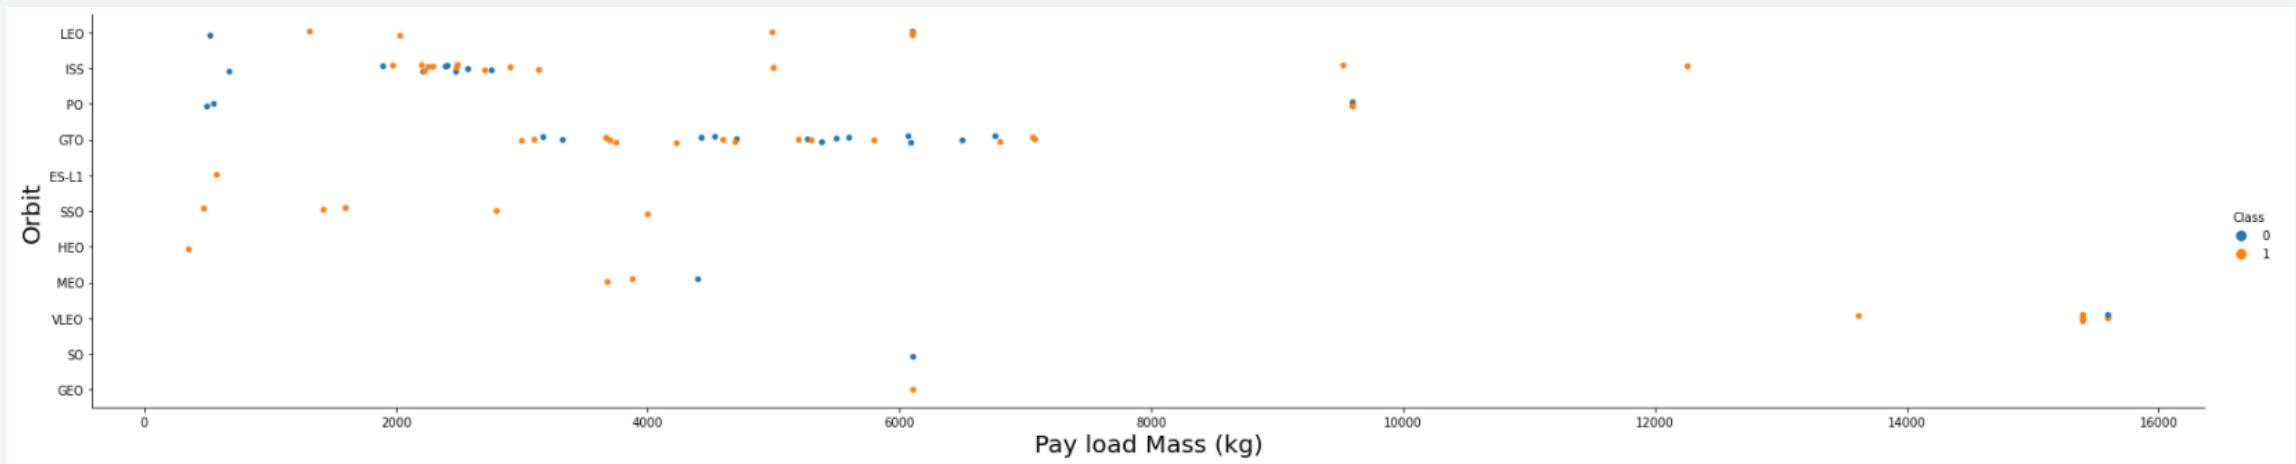

- Success appears related to the number of flights for LEO orbit
- No obvious relationship between flight number when in GTO orbit.

# Payload vs. Orbit Type

---

- Scatter point of payload vs. orbit type

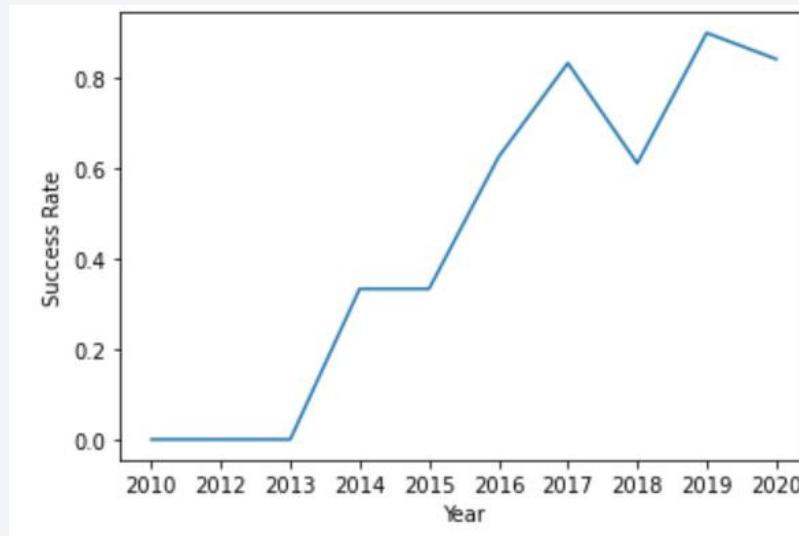

- With heavy payloads - successful landing or positive landing rates are higher for Polar, LEO, and ISS orbit types.
- No obvious trend for GTO orbit

# Launch Success Yearly Trend

---

- Line chart of yearly average success rate

- In general, success rate of launches have been increasing since 2010

# All Launch Site Names

---

- Names of the unique launch sites

Display the names of the unique launch sites in the space mission

```
%sql select distinct(LAUNCH_SITE) from SPACEXDATASET
```

```

# Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

---

- Ranked count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order

```
%sql select LANDING_OUTCOME, COUNT(LANDING_OUTCOME) \
from SPACEXDATASET \
WHERE DATE between '2010-06-04' AND '2017-03-20' \
GROUP BY LANDING_OUTCOME \
ORDER BY COUNT(LANDING_OUTCOME) DESC
```

```
* ibm_db_sa://fxn66192:***@ba99a9e6-d59e-4883-8fc0-d6a1
Done.
```

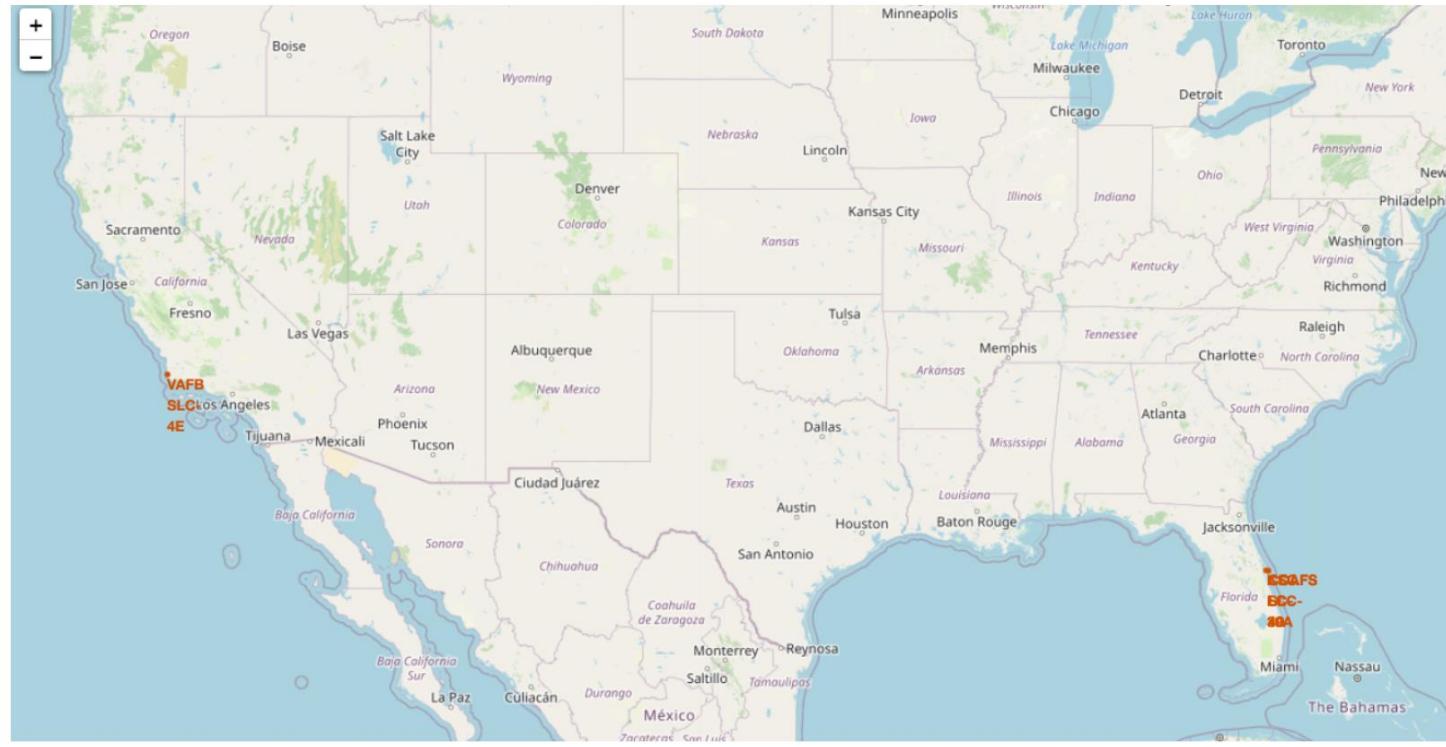

landing_outcome	count
No attempt	10
Failure (drone ship)	5
Success (drone ship)	5
Controlled (ocean)	3
Success (ground pad)	3
Failure (parachute)	2
Uncontrolled (ocean)	2
Precluded (drone ship)	1

The background of the slide is a photograph taken from space at night. It shows the curvature of the Earth's horizon against a dark blue sky. Numerous city lights are visible as small white dots, with larger clusters of lights indicating major urban centers. In the upper right quadrant, there is a bright, horizontal band of light, likely the Aurora Borealis or Southern Lights.

Section 4

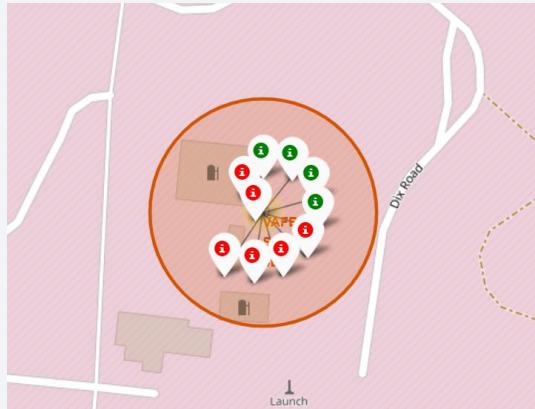

# Launch Sites Proximities Analysis

# Launch Sites

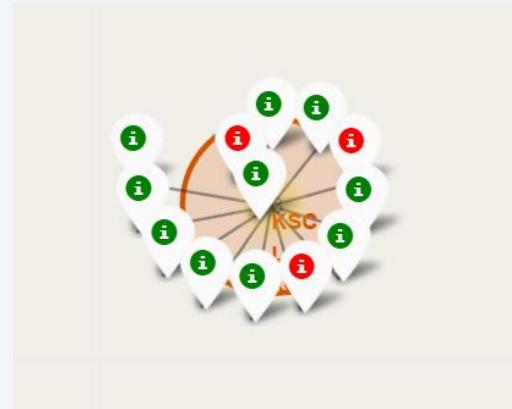

- Launch sites are located at coastlines and close to the equator

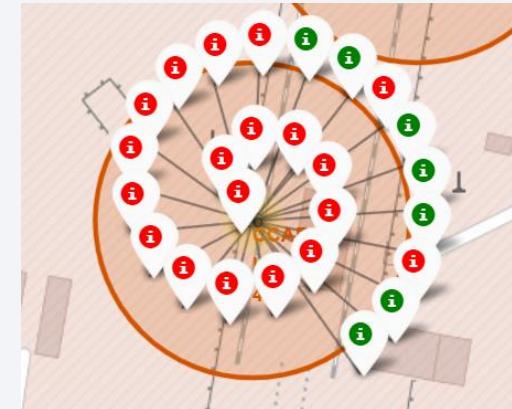

# Launch outcomes at each launch site

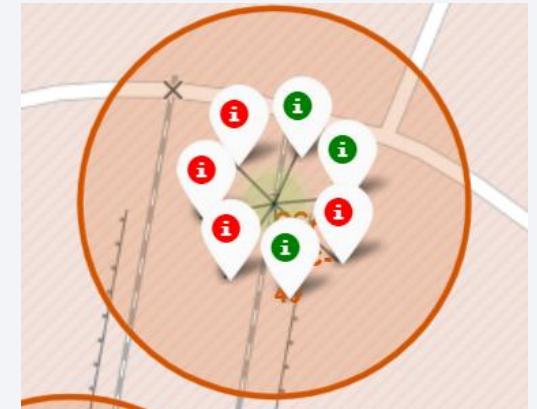

VAFB SLC-4E

KSC LC-39A

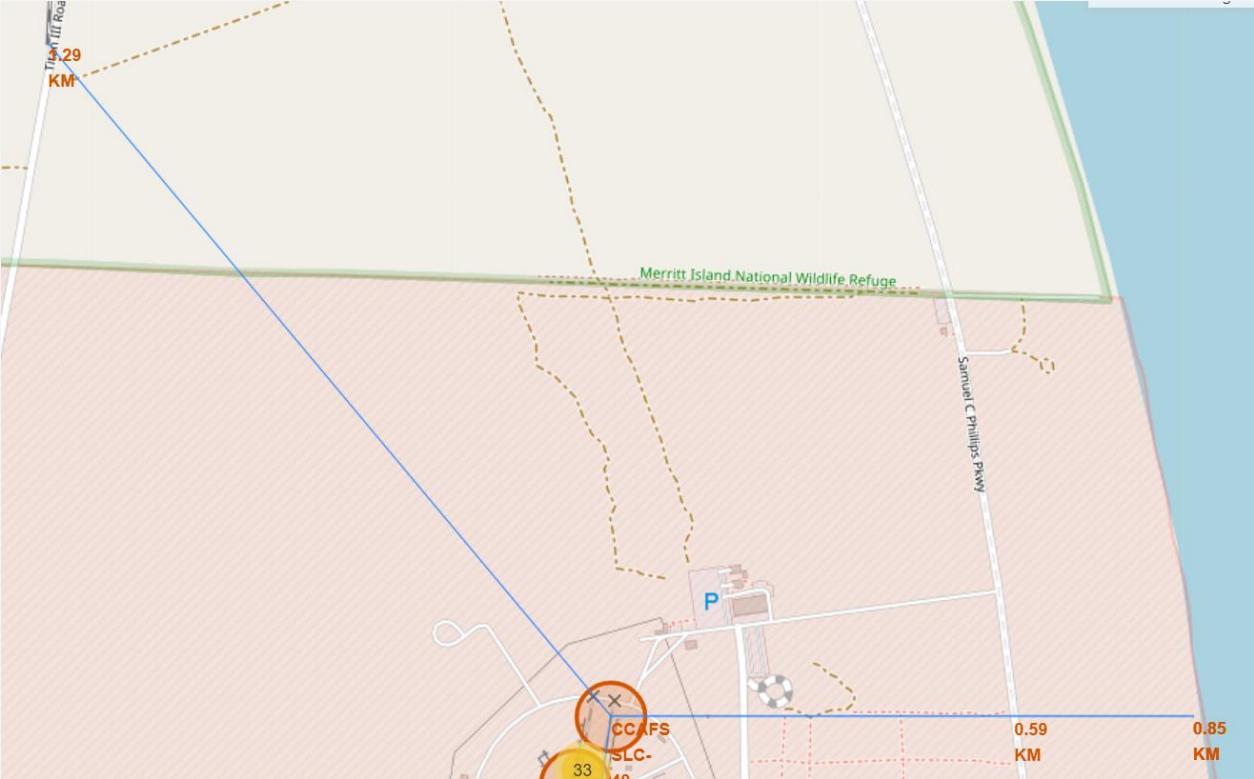

CCAFS LC-40

CCAFS SLC-40

- Green markers indicate successful launches
- Red markers indicate unsuccessful launches
- From this visual representation, KSC LC-39A has the highest proportion of successes, followed by CCAFS SLC-40, VAFB SLC-4E and CCFS LC-40

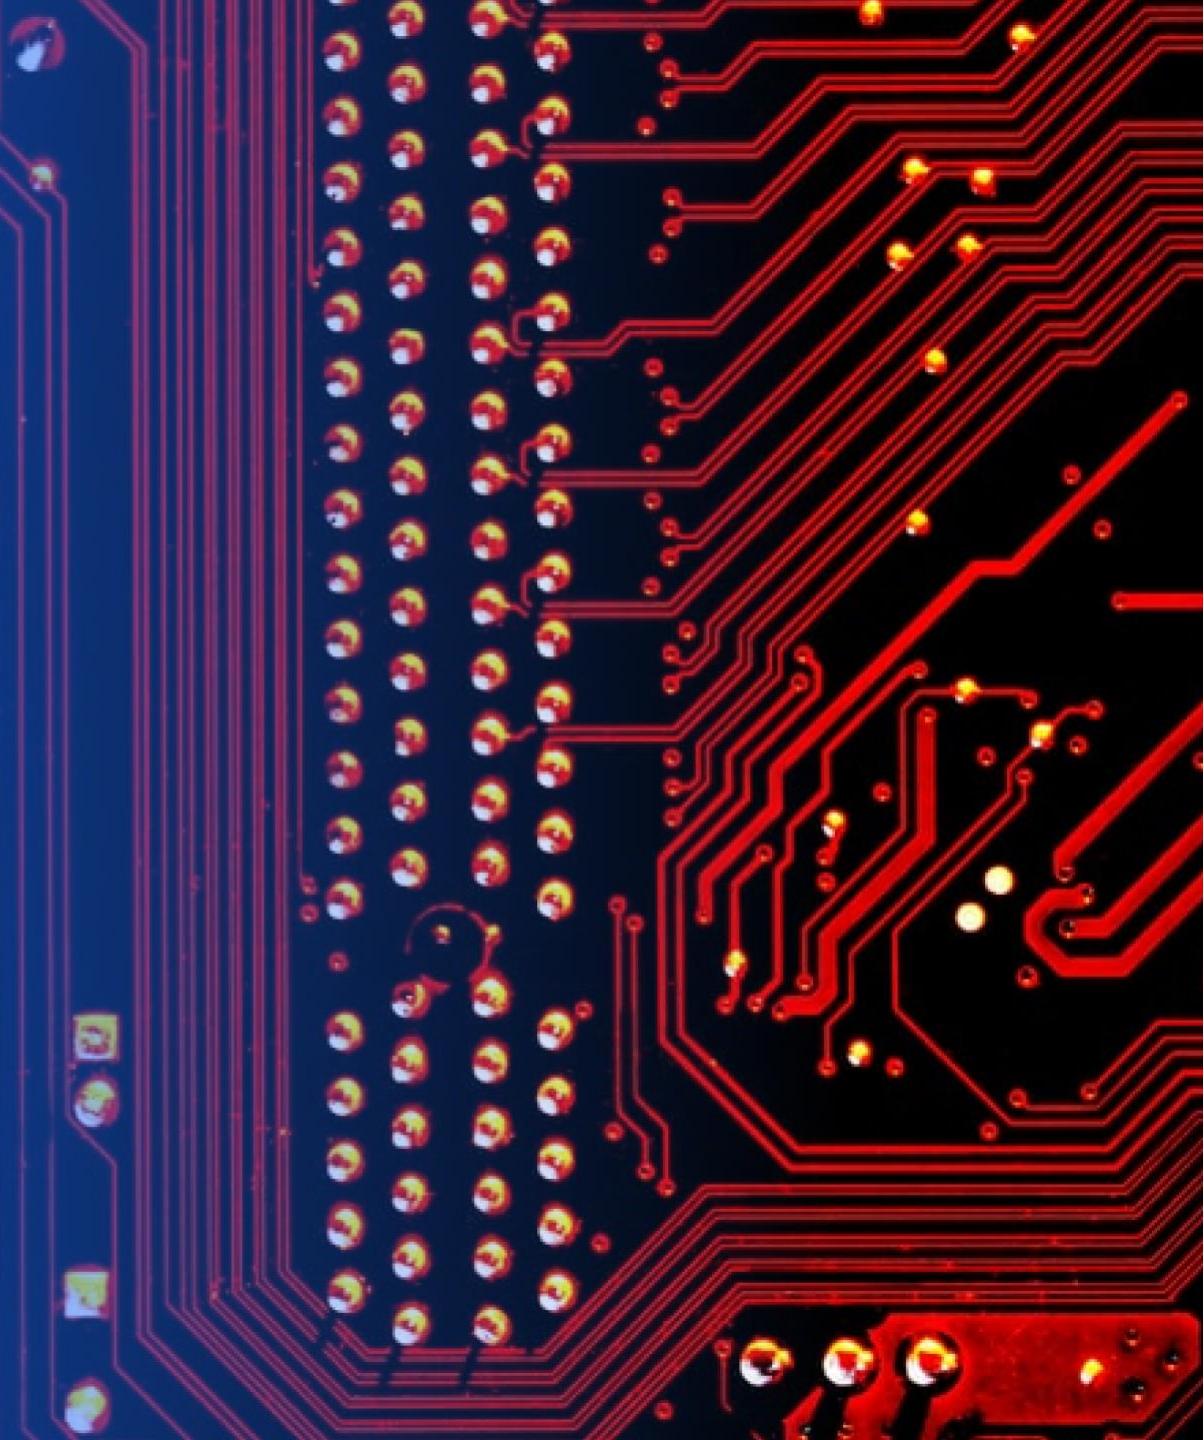

# Proximity of launch site to various infrastructure

- Launch sites may be located close to transport infrastructure like railroads and highways, however they are located far away from cities

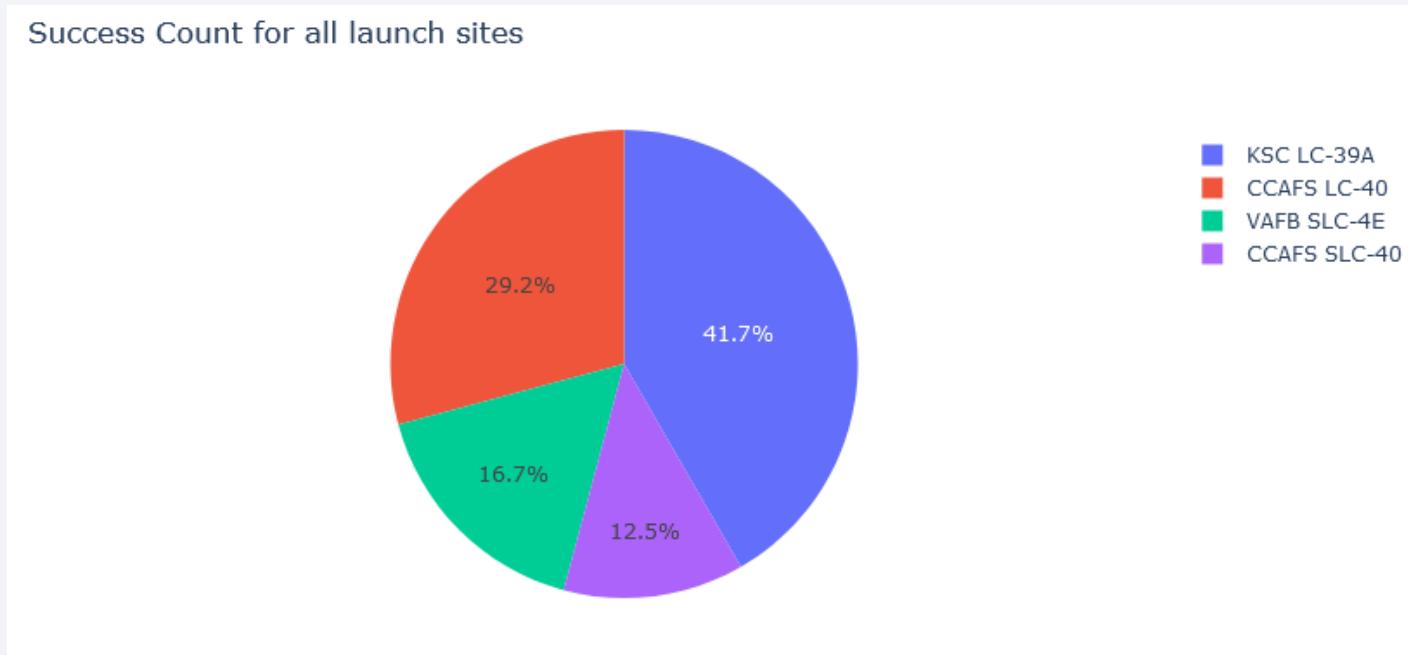

Section 5

# Build a Dashboard with Plotly Dash

# Success rate for all launch sites

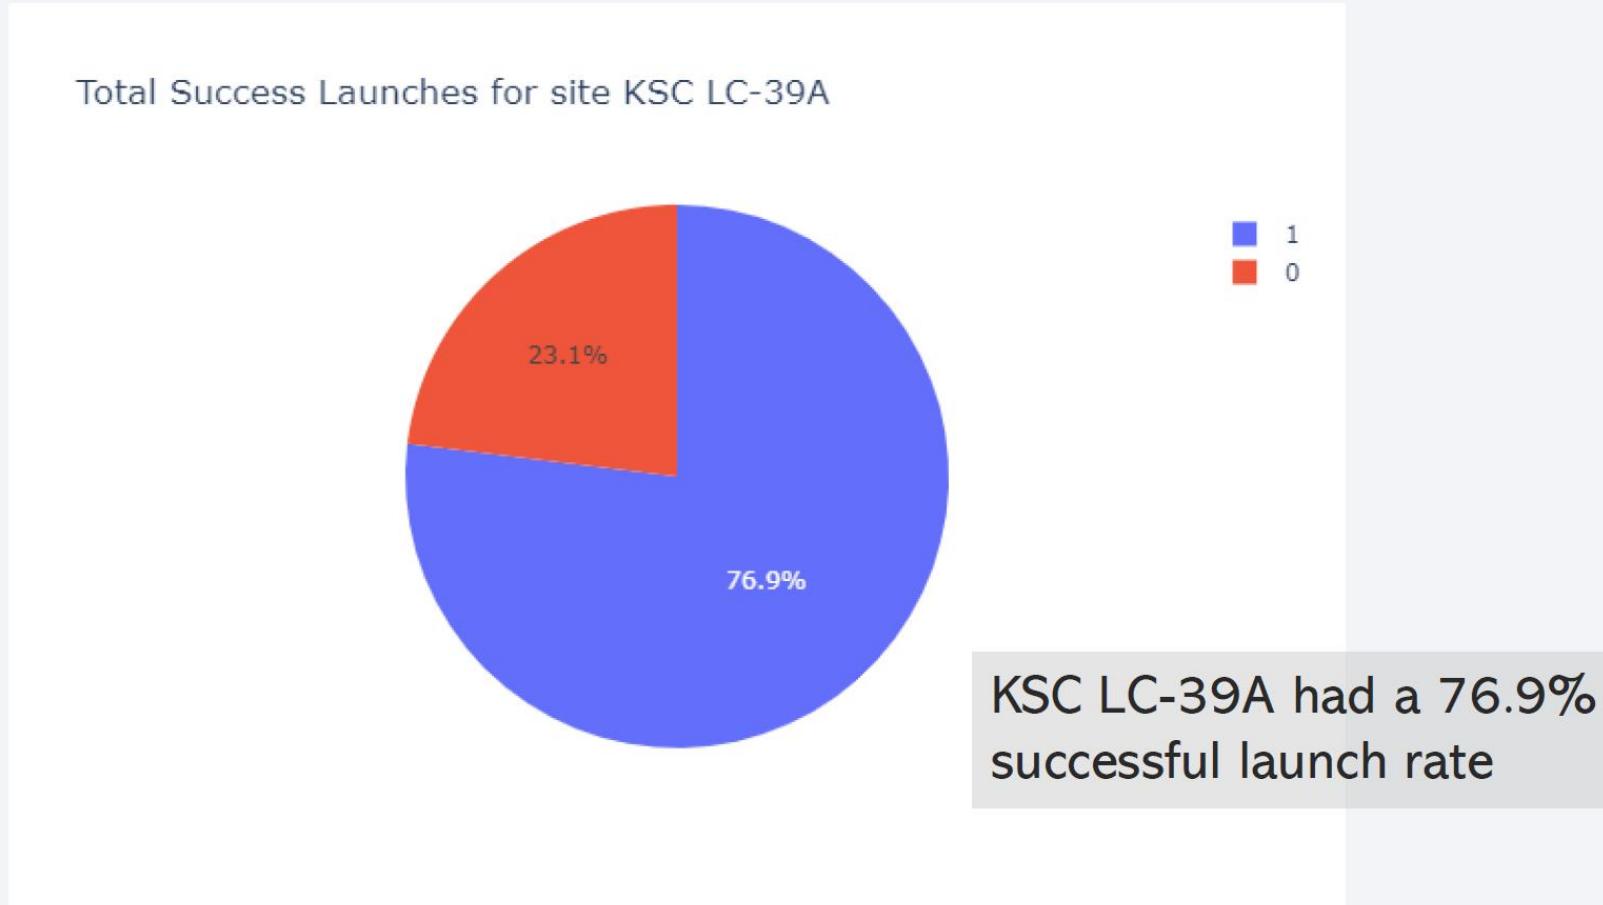

---

- KSC LC-39A has the highest proportion of successes, followed by CCAFS LC-40, VAFB SLC-4E and CCAFS SLC-40

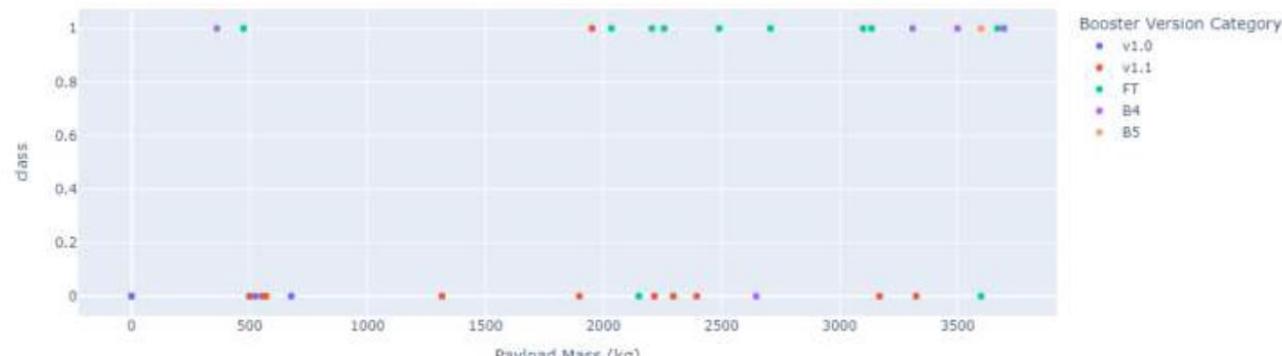

# Launch site with highest launch success ratio

---

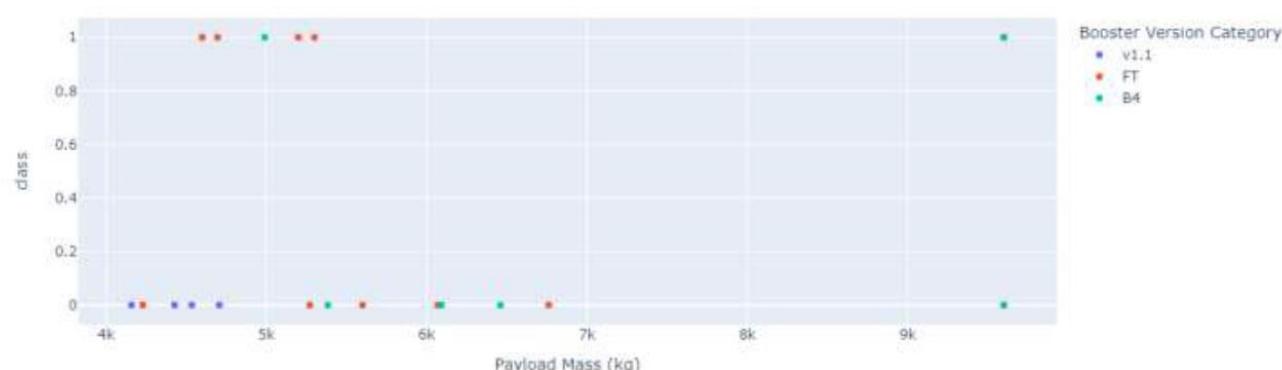

# Payload vs Launch Outcome

Success count on Payload mass (0 to 4000kg) for all sites

Success count on Payload mass (4000kg and above) for all sites

- 1) Higher success rate at lower Payload mass
- 2) FT Booster Version seems to have a higher success rate

The background of the slide features a dynamic, abstract design. It consists of several thick, curved lines that transition from a bright yellow at the top right to a deep blue at the bottom left. These lines create a sense of motion and depth, resembling a tunnel or a stylized landscape. The overall effect is modern and professional.

Section 6

# Predictive Analysis (Classification)

# Classification Accuracy

---

- Accuracy of various models as follows:
  - Logistic regression: 0.875
  - SVM: 0.889
  - Tree: 0.861
  - KNN: 0.861
- Hence SVM has the highest accuracy

# Confusion Matrix

---

- The Matrix shows that SVM was able to predict accurately true positive of successful landing, but it still have several false positive for failure to land

# Conclusions

---

- Orbit ES-L1, GEO, HEO and SSO have the best Success Rates
- Overall the success rates of launches increase over the years
- KSC LC-39A had the most successful launches from all launch sites
- Lower weighted payload performed better than heavier ones
- SVM Classifier Algorithm is best suited for Machine Learning of this data set

Thank you!
